Your README is becoming part of your AI infrastructure.

Your AI coding assistant can generate code. But does it understand your codebase?

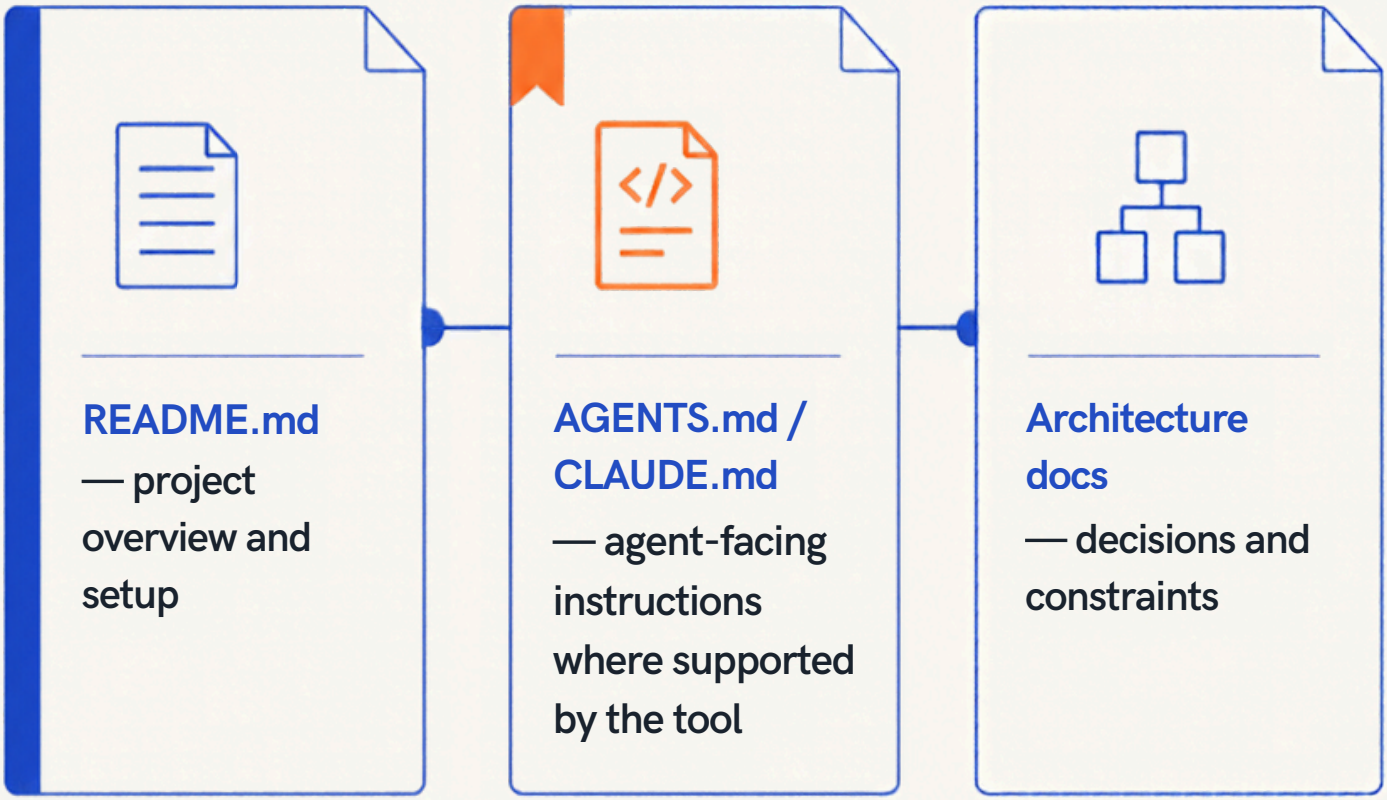

Missing context creates unnecessary assumptions.

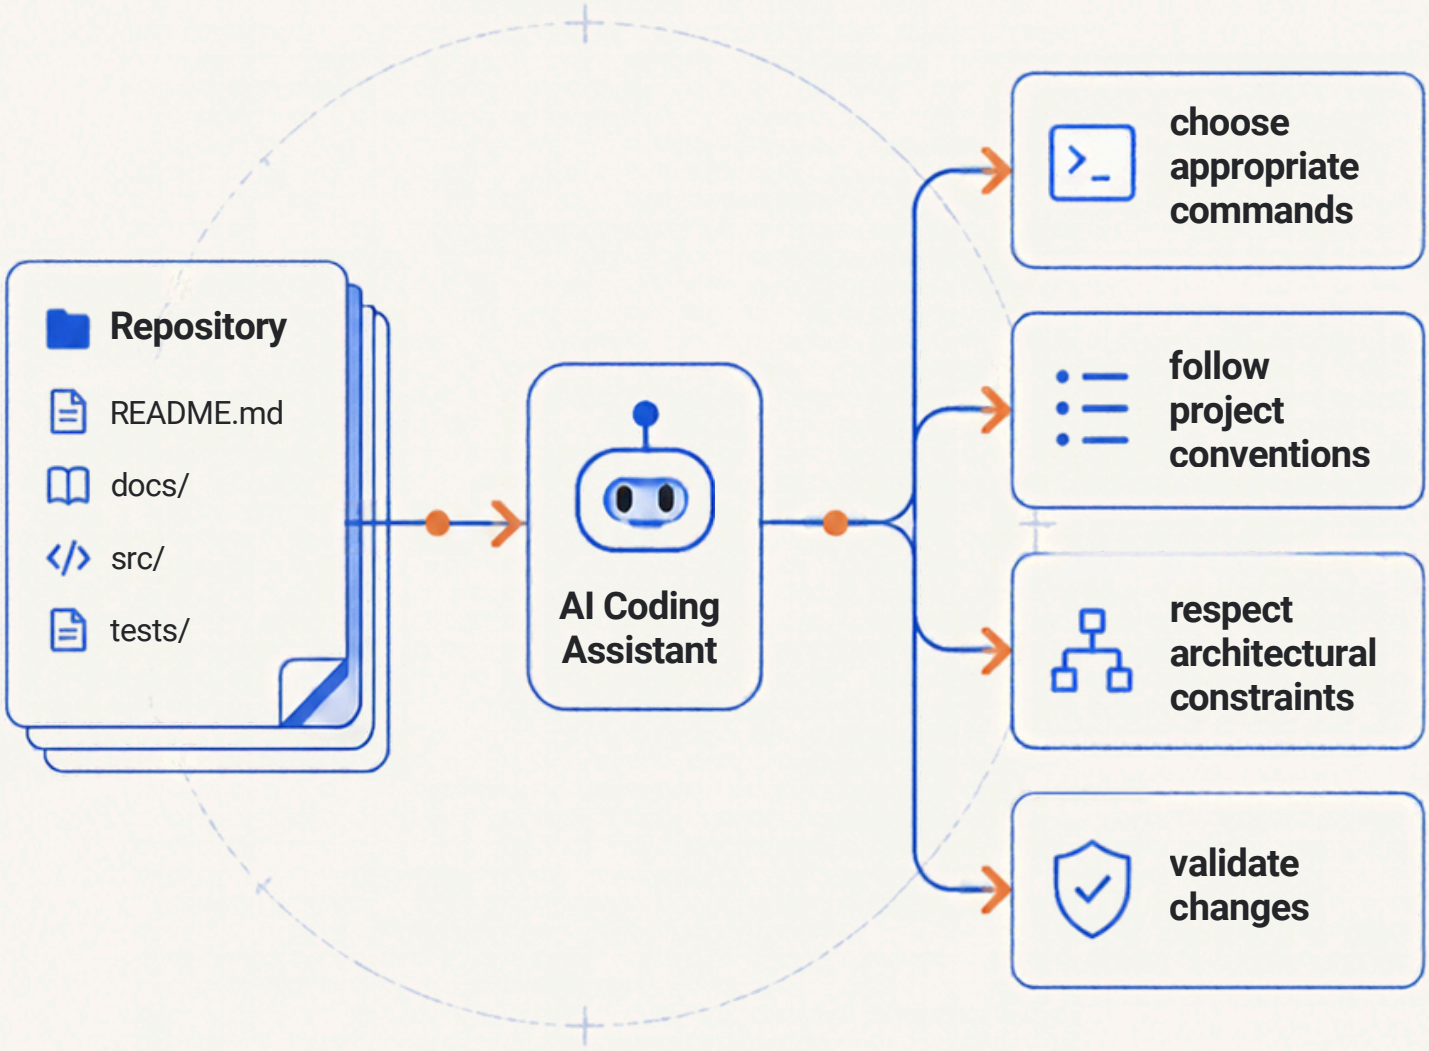

Tools can inspect repositories.
Accurate, findable guidance reduces ambiguity.

Give your repository a clear instruction layer.

Tool support varies.

Better context.
Fewer avoidable mistakes.

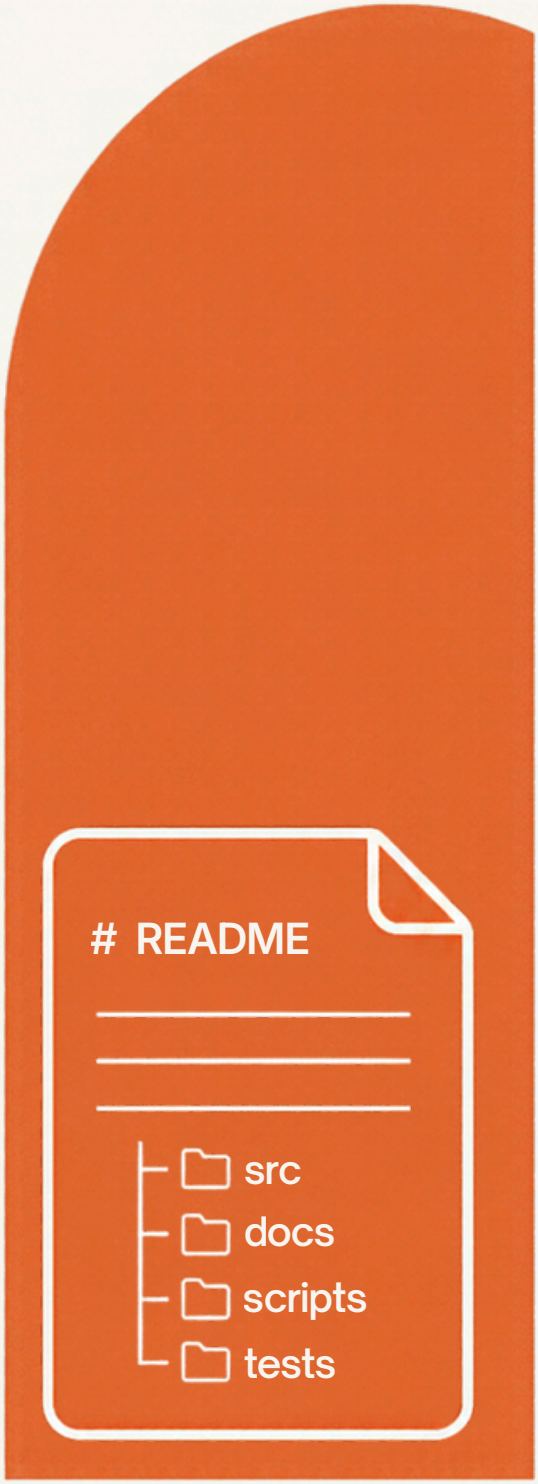

Documentation helps. Tests and code review still matter.

Don't just improve the prompt.

Improve the repository.

- [ ] Can someone run the project from the README?
- [ ] Are conventions documented?
- [ ] Can the coding tool find the relevant instructions?

How are you preparing your codebase for AI-assisted development?
